

```
1 I first had a general overview of the data, then prepared it by loading the rating data,  
2 loading the movie metadata,merging the datasets.  
3 prepared the data for surprise.  
4 One of the key needs that a surprise library needs  
5 is the rating scale,this simply tells the system that there minimum and maximum possible  
  rating  
6 I then stinstalled the scikit surprise,split the data into training and testing then built  
7 the item based collaborative filtering model by configure the model.  
8 then later made recommendations then retrieved the recommendations.
```
